

ABOUT LIVE SIGN

Live Sign is a company dedicated to eliminate plastic into our environment.

Live sign has unique online software to allow you to design your very own real estate sign.

Live sign uses an eco-friendly alloy case with your designed biodegradable paper poster inserted.

Each sign can be reused over and over.

The case is mounted either to a fence or our engineered ground screws.

Each case is painted with your company colours.

Live sign also has a solar lighting system inserted for illumination at night.

A FEW FUN FACTS!

Plastic.....YUK!

While we know that we cant solve all problems.... we can try to do everything we can to help our city, our country, our world.

The manufacture of plastic, as well as its destruction by incineration, pollutes air, land and water and exposes workers to toxic chemicals, including carcinogens. ... Synthetic plastic does not biodegrade.

It just sits and accumulates in landfills or pollutes the environment.

Corflute, (polypropylene) what traditional Real Estate signs are made of are not widely recyclable due to the toxins that the polypropylene emits and therefore it is more than likely that a good percentage of these signs make it to our landfill.

Whats' 1 sign here or there I hear you say?

NZ Property Report for July 2017 7933 houses came on the market (All with Signs)

Will My Real Estate Sign Really Be here in 2518?

polypropylene doesnt biodegrade, it does photodegrade. When exposed to ultraviolet radiation from sunlight, the polypropylene polymer chains become brittle and start to crack. This suggests that eventually the signs may become fragmented granules.

As of yet, however, scientists aren't sure how many centuries it takes for the sun to work its magic. That's why certain news sources cite a 500-year estimate while others prefer a more conservative 1,000-year lifespan.

According to some plastics experts, all these figures are just another way of saying "a really, really long time."
